

Pillars

Pillar 1 --- AI & Technology Education

Allocation: 20%

Objective

Explain complicated technology in simple language that business owners, founders, operators, and technology leaders can understand.

Example Topics

What exactly is an AI agent?

AI Agent vs Chatbot

What is RAG?

What is an API?

What happens when an OTP is sent?

What does an LLM actually do?

What is vector search?

AI workflow vs traditional automation

What is MCP?

What does "agentic AI" actually mean?

Where should businesses use AI?

Where should businesses NOT use AI?

What is an embedding?

What is a vector database?

What is workflow orchestration?

AI assistant vs AI agent

What is human-in-the-loop AI?

Why do AI systems hallucinate?

Recommended Structure

HOOK

A simple question or misconception

↓

CONCEPT

Explain it without jargon

↓

EXAMPLE

Use a normal business situation

↓

WHY IT MATTERS

Connect technology to business

↓

TAKEAWAY

One memorable idea

Example

An AI Agent and a Chatbot aren't the same thing.

A chatbot answers.

An agent can act.

Imagine asking:

"Which customers haven't paid us this month?"

A chatbot might explain how to find them.

An AI agent could check your database, identify overdue invoices, prepare reminders, and create follow-up tasks.

That's the difference between AI that talks and AI that works.

Reference

Study strong AI and automation companies such as n8n for how they translate technical concepts into real business examples. Learn the structure, not their wording or product claims.

Pillar 2 --- Business Problem

Allocation: 15%

Objective

Describe operational problems businesses regularly face in a way that makes readers think:

"We have exactly this problem."

Example Topics

Why Excel becomes difficult as companies grow

Information trapped in WhatsApp

Duplicate customer data

Manual approvals

Employees maintaining the same information in multiple places

No single source of truth

Manual reporting

Forgotten customer follow-ups

Business knowledge existing only in someone's head

Departments operating in silos

Software employees do not actually use

Reports arriving too late to be useful

Re-entering the same data into multiple systems

Processes that depend entirely on one employee

Managers lacking real-time visibility

Recommended Structure

OBSERVATION

↓

PAIN

↓

WHY IT HAPPENS

BETTER WAY OF THINKING

TAKEAWAY / QUESTION

Example

If your business stops working when one employee goes on leave, you may not have a people problem.

You might have a process problem.

Maybe only one person knows which spreadsheet is updated.

Only one person knows which customers need follow-up.

Only one person knows how the monthly report is prepared.

Good systems don't replace good employees.

They make sure knowledge doesn't disappear when someone isn't available.

Pillar 3 --- Digital Transformation

Allocation: 15%

Objective

Help businesses understand what genuine digital transformation means.

Example Topics

Digitization vs digitalization vs digital transformation

Buying software is not digital transformation

Why software adoption fails

Why processes should be fixed before digitizing them

Manual → digital → automated → intelligent

What SMEs should digitize first

Why adding more software does not necessarily solve problems

Creating a single source of truth

Data-driven decision making

Why disconnected systems create operational problems

Why digital transformation is primarily a process problem

Example

Digitization is not converting your register into Excel.

Paper register → Excel is digitization.

Excel → connected system is digitalization.

Connected system → automated workflows is transformation.

Automated workflows → systems that can reason and act is where AI starts becoming interesting.

Many businesses are trying to jump from Step 1 to Step 4.

Pillar 4 --- Automation Ideas

Allocation: 15%

Objective

Show businesses practical workflows that can be automated.

Avoid vague statements such as "AI can automate customer support." Show the workflow.

Example Topics

Five things a business can automate this week

Customer follow-ups

Invoice reminders

Daily reports

Lead assignment

Support ticket classification

Employee onboarding

Lead qualification

Customer support automation

Invoice processing

Approval workflows
Report generation
Document processing
Appointment scheduling
Customer feedback collection
Data synchronization
Notification and escalation workflows

Recommended Structure

Customer sends message

↓

AI understands request

↓

Checks customer/account

↓

Answers simple issue

↓

Creates ticket if required

↓

Assigns correct team

↓

Updates CRM

Rule

Never discuss automation without making the workflow understandable.

Pillar 5 --- Builder / Founder Insights

Allocation: 10%

Objective

Share genuine observations and lessons ELVA learns while building technology and working with businesses.

This should not become generic startup motivation.

Example Topics

What we learn talking to traditional businesses

Why requirements change after customers see software

Why understanding a workflow is harder than coding it

What building software for different industries teaches us

Why founders should not automate broken processes

Why customers describe symptoms instead of requirements

Why simple software is difficult to build

What implementing AI in real workflows teaches us

Why software requirements often hide deeper business problems

What we learn from watching users actually use software

Example

One thing building software for businesses has taught us:

Customers rarely describe the actual problem.

They'll say:

"We need a report."

But when you keep asking why, the real problem might be:

"I don't know what's happening in my business until the end of the month."

The report isn't the requirement.

Visibility is.

Understanding that difference is often harder than writing the code.

Rule

The agent must never invent founder experiences.

Builder posts must come from approved ELVA knowledge, documented experiences, or human-provided context.

Pillar 6 --- Industry Technology

Allocation: 10%

Objective

Explain how technology affects real industries.

This differentiates ELVA from generic AI pages.

Example Topics

Dairy - How milk procurement works

Dairy - FAT/SNF concepts

Dairy - Digital payments to farmers

Dairy - Milk traceability

Education - Attendance data

Education - Fee management

Education - Student lifecycle management

Education - Parent communication

Retail - Inventory visibility

Retail - Hyperlocal commerce

Retail - Why local stores struggle with digital adoption

Retail - Customer retention

Manufacturing - Production tracking

Manufacturing - Quality control

Manufacturing - Inventory

Manufacturing - Predictive maintenance

Pillar 7 --- Opinions & Discussions

Allocation: 10%

Objective

Publish thoughtful, defensible opinions that encourage discussion without manufacturing controversy.

Example Topics

Every business does not need AI.

Excel is not bad software; businesses often ask it to do jobs it was never designed for.

Buying an ERP does not digitally transform a company.

AI agents will not fix broken processes.

The best business software is often software employees barely notice.

SMEs may not have a data problem; they may have a data-organization problem.

Automation should not always begin with AI.

More software does not necessarily mean better operations.

A dashboard is useless if the underlying data is unreliable.

The best automation sometimes removes a step rather than automating it.

Rule

Opinions must be defensible, relevant to ELVA's expertise, useful, respectful, and supported by reasoning.

Avoid generic engagement bait such as "Agree?"

Pillar 8 --- Tech Behind Everyday Things

Allocation: 5%

Objective

Explain the invisible technology behind everyday digital experiences.

Example Topics

What actually happens when you:

Receive an OTP?

Scan a QR code?

Click "Pay Now"?

Place an online order?

Use Google login?

Receive a WhatsApp notification?

Search for something?

Reset your password?

Make a UPI payment?

Upload a file?

Use a URL shortener?

Receive an email notification?

Example

You scan a QR code and ₹500 reaches a shopkeeper.

It feels instantaneous.

Behind that simple action, multiple systems have to identify you, identify the merchant, authenticate the transaction, communicate with banks, validate the payment, and confirm its status.

Great technology often feels boring to the user.

That's usually the point.

Original examples

Approximately 0–4 useful hashtags

Natural discussion questions when appropriate

Specific workflows

Clear takeaways
